

ABSTRACT

The method for establishing and managing a trust relationship between an identification module and a radio terminal comprises a terminal authentication step by said identification module done by using authentication
5 means such as a key, said authentication means being provided to at least said identification module by a mobile radio-telephony network at the time of an initialization step or the like or at the time of a so-called updating.

In the method according to the invention, a key revocation step that can be carried out on the initiative of the identification module, the terminal,
10 or the radio-telephony network comprises the erasure in a memory of said identification module of the key associated with the terminal.
